1. Why we use Code First rather than DB First?

Full Control: It gives developers full control over the database schema directly from C# code.

Version Control: It allows tracking database changes using Migrations, which can be stored in Git.

Single Source of Truth: The C# classes are the only source of truth, making the system easier to maintain.

2. Why we use Fluent API over Data Annotations?

Separation of Concerns: It keeps the Entity classes "clean" and free from database-specific attributes.

More Powerful: Fluent API supports advanced configurations (like composite keys or specific decimal precision) that Data Annotations cannot handle.

Flexibility: It allows you to change database mappings without modifying the core Model classes.
